

Decision 4 – Stata vs app: Research Baseline and Research Specification

Research Baseline – Options List Length – Tendency to Plan score

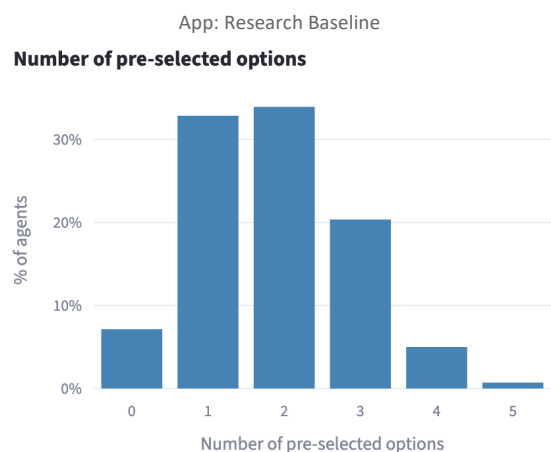

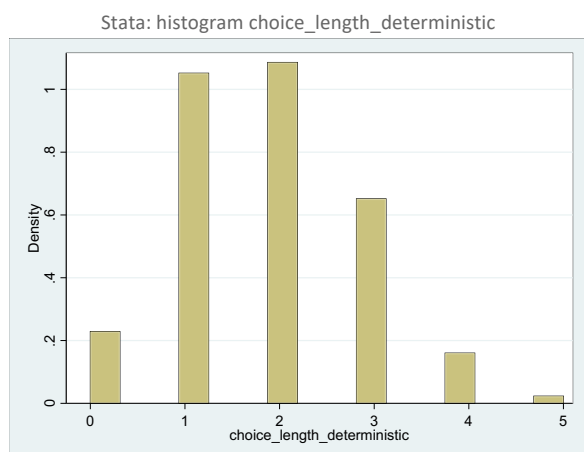

Agents 280 · Income: not used · $\beta_0 = 0$ (Stata: no intercept) · σ : none

Match

Research Baseline – Options List Length – number of pre-selected options

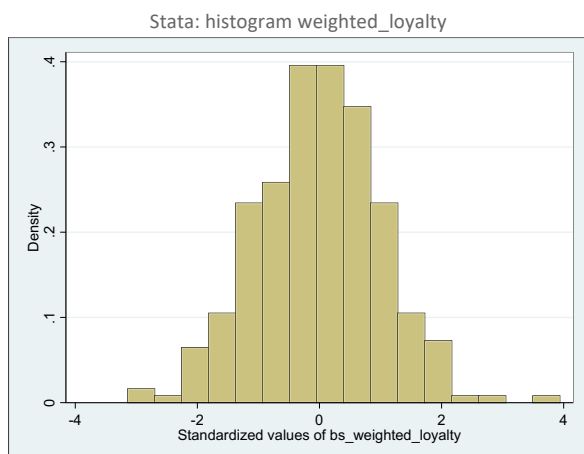

Agents 280 · Income: not used · $\beta_0 = 0$ (Stata: no intercept) · σ : none

Match (7.1 / 32.9 / 33.9 / 20.4 / 5.0 / 0.7 % of agents for 0–5 options). Stata's y-axis is density, the app's is % of agents but the shape is the same.

Research Baseline – Loyalty – score

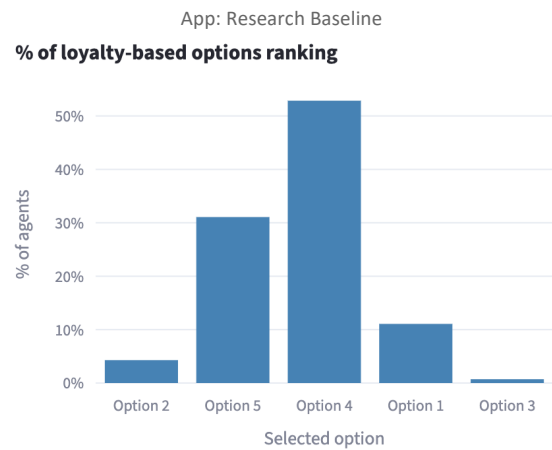

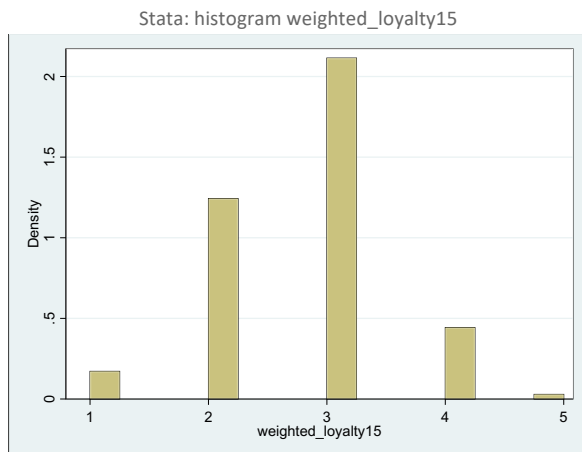

Agents 280 · Income: not used · $\beta_1 = 0$ · σ : none

Match

Research Baseline – Loyalty – options ranking

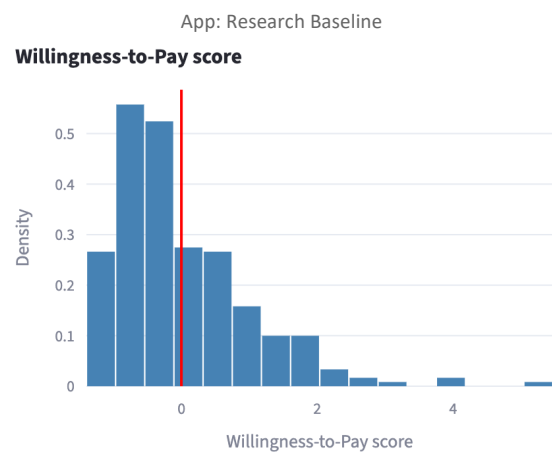

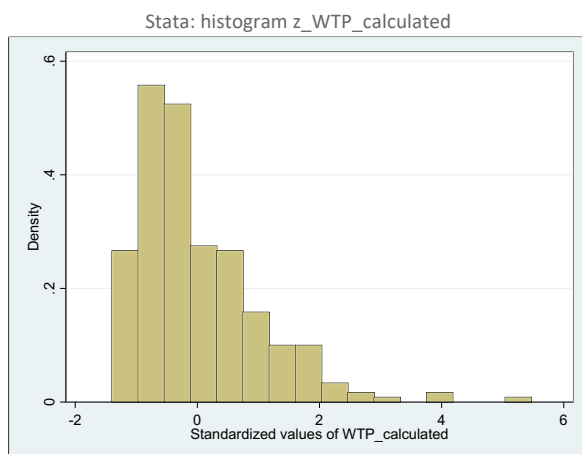

Agents 280 · Income: not used · $\beta_1 = 0$ · σ : none

Match (4.3 / 31.1 / 52.9 / 11.1 / 0.7 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Baseline – Willingness-to-Pay – score (continuous income)

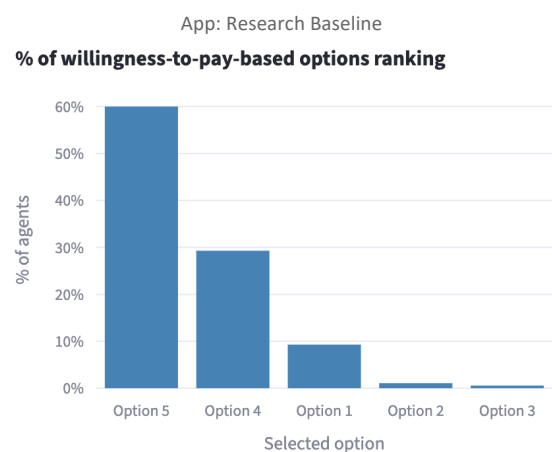

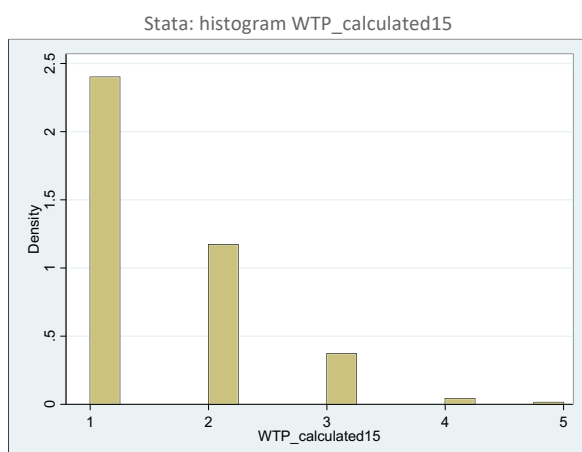

Agents 280 · Income: Continuous only · $\beta_2 = 0$ · σ : none

Match

Research Baseline – Willingness-to-Pay – options ranking (continuous income)

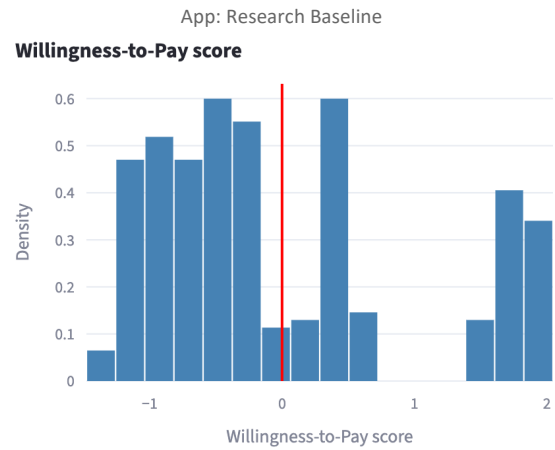

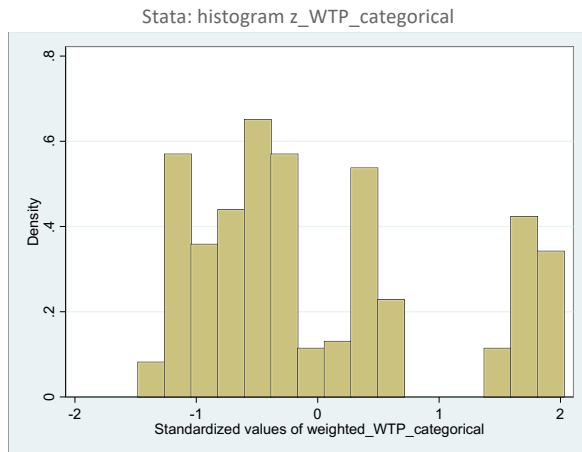

Agents 280 · Income: Continuous only · $\beta_2 = 0$ · σ : none

Match (60.0 / 29.3 / 9.3 / 1.1 / 0.4 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Baseline – Willingness-to-Pay – score (categorical income)

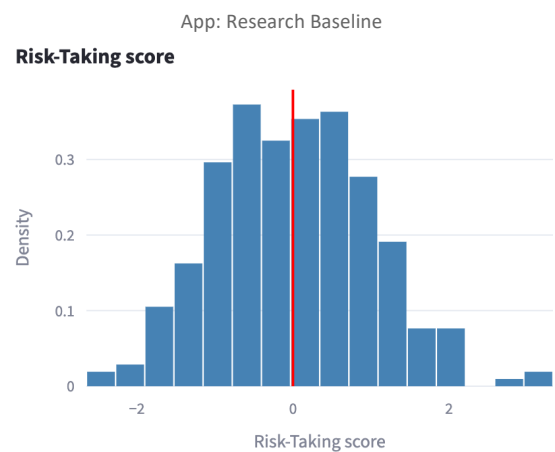

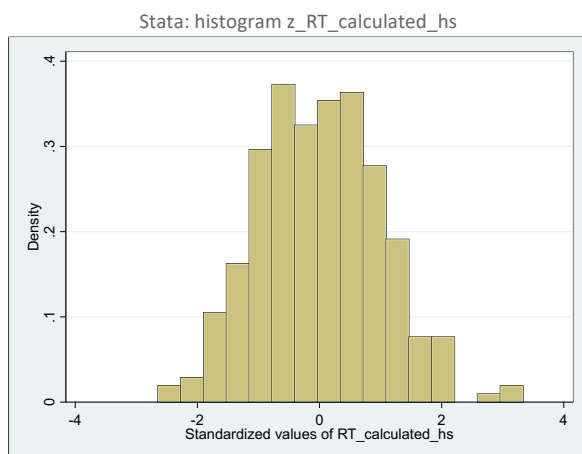

Agents 280 · Income: Categorical only · $\beta_2 = 0$ · σ : none

Does not match. In the Stata file, the lowest allowance level (57 participants) used the raw Agreeableness score instead of the standardised one; the other levels and the document use the standardised one, as the app does. Re-running Stata with that fix should make the graphs match.

Research Baseline – Risk-Taking – score (continuous income)

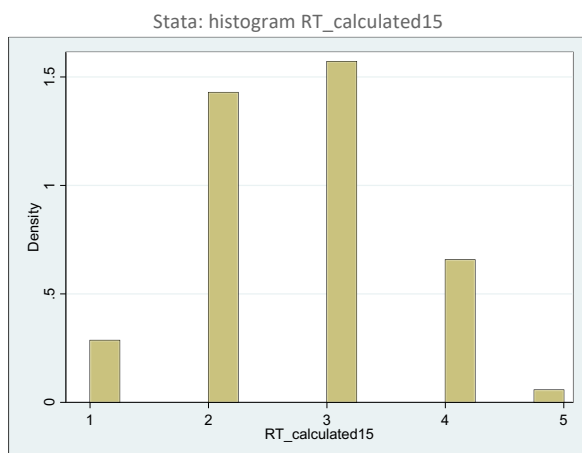

Agents 280 · Income: Continuous only · $\beta_3 = 0$ · σ : none

Match

Research Baseline – Risk-Taking – options ranking (continuous income)

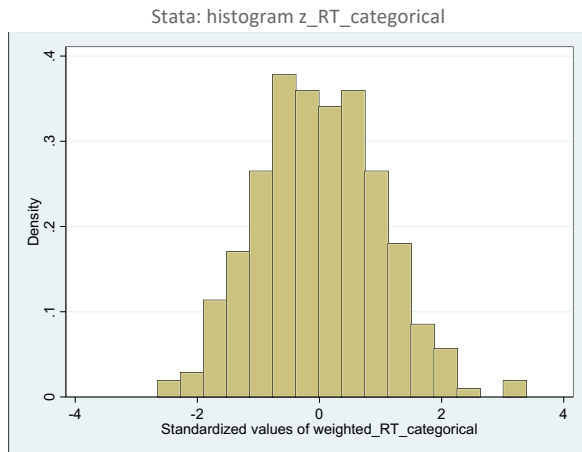

Agents 280 · Income: Continuous only · $\beta_3 = 0$ · σ : none

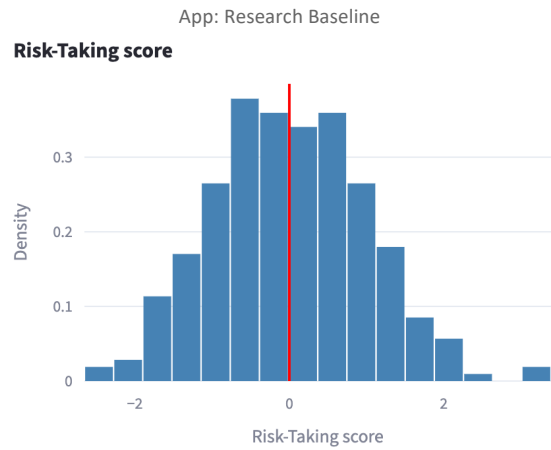

Match (7.1 / 35.7 / 39.3 / 16.4 / 1.4 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Baseline – Risk-Taking – score (categorical income)

Agents 280 · Income: Categorical only · $\beta_3 = 0$ · σ : none

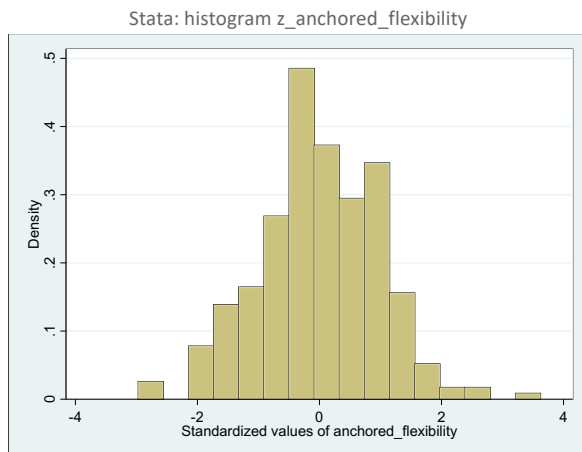

Match

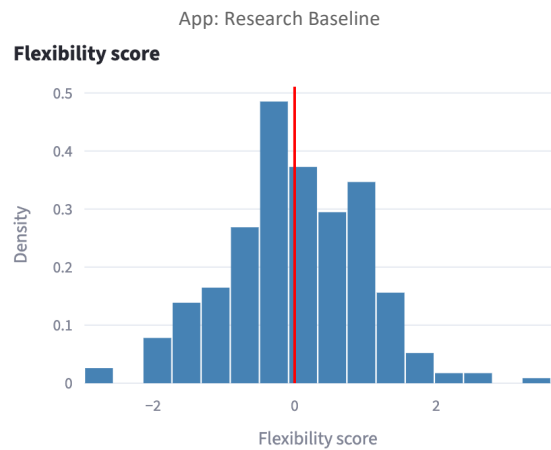

Research Baseline – Flexibility – score

Agents 280 · Income: not used · $\beta_4 = 0$ · σ : none

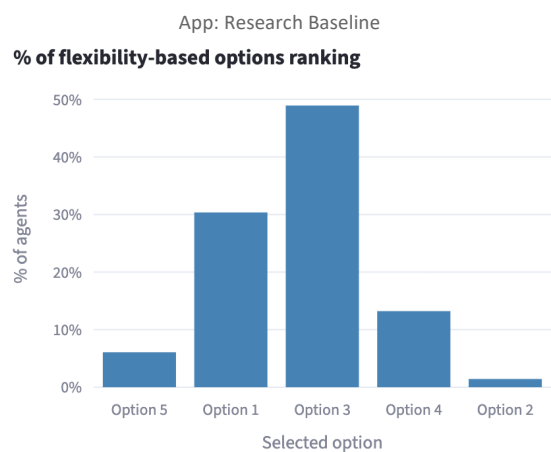

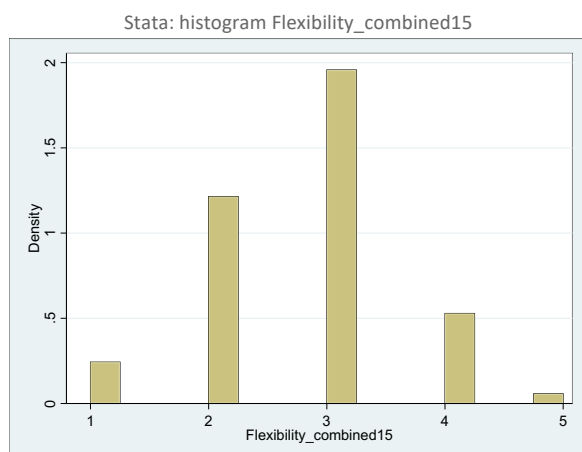

Match

Research Baseline – Flexibility – options ranking

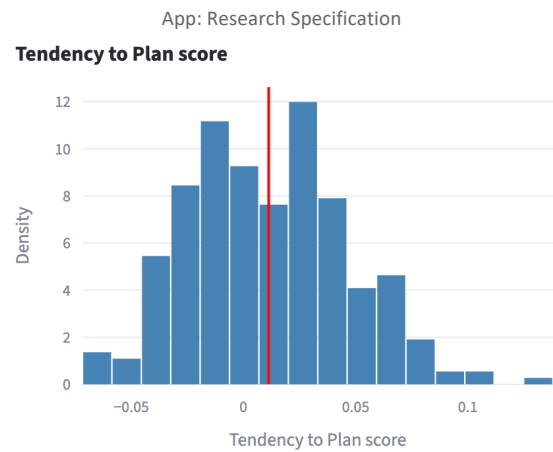

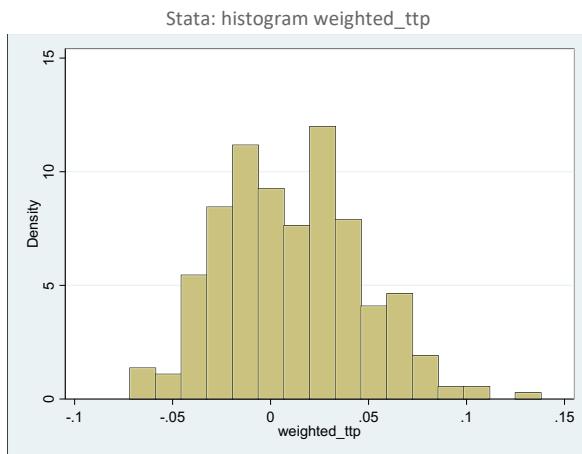

Agents 280 · Income: not used · $\beta_4 = 0$ · σ : none

Match (6.1 / 30.4 / 48.9 / 13.2 / 1.4 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Specification – Options List Length – Tendency to Plan score

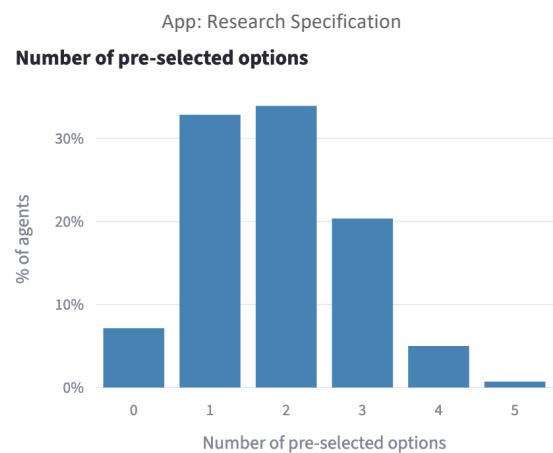

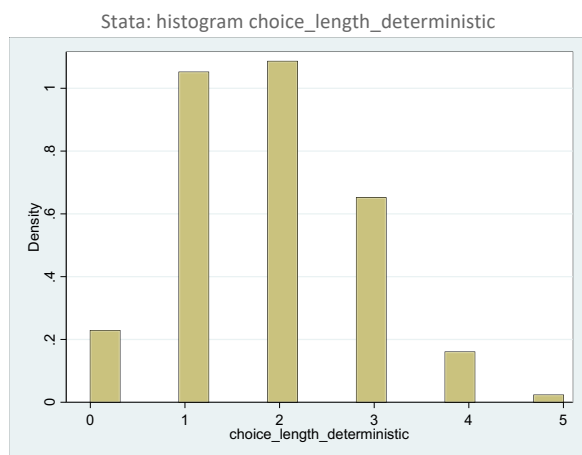

Agents 280 · Income: not used · $\beta_0 = 0$ (Stata: no intercept) · σ : none (turned off in the app)

Match

Research Specification – Options List Length – number of pre-selected options

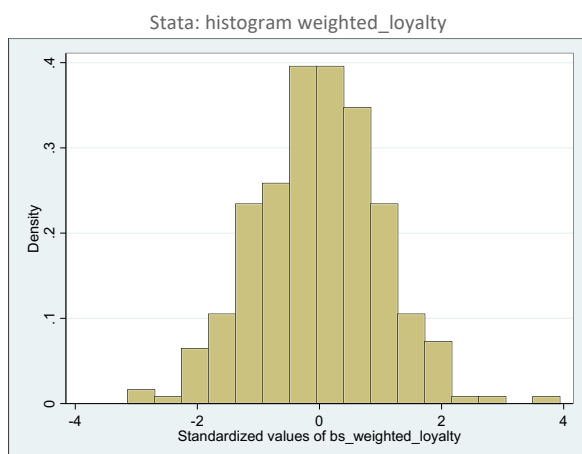

Agents 280 · Income: not used · $\beta_0 = 0$ (Stata: no intercept) · σ : none (turned off in the app)

Match (7.1 / 32.9 / 33.9 / 20.4 / 5.0 / 0.7 % of agents for 0–5 options). Stata's y-axis is density, the app's is % of agents but the shape is the same.

Research Specification – Loyalty – score

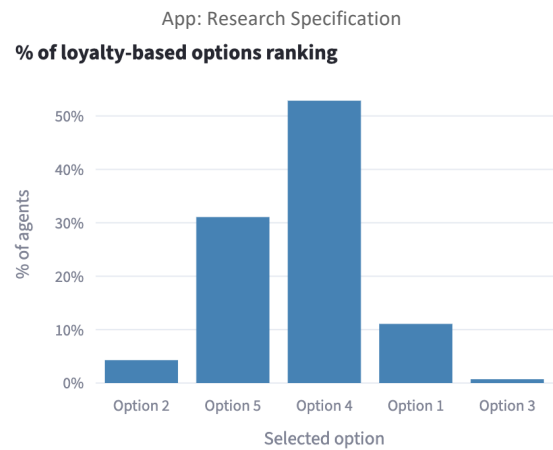

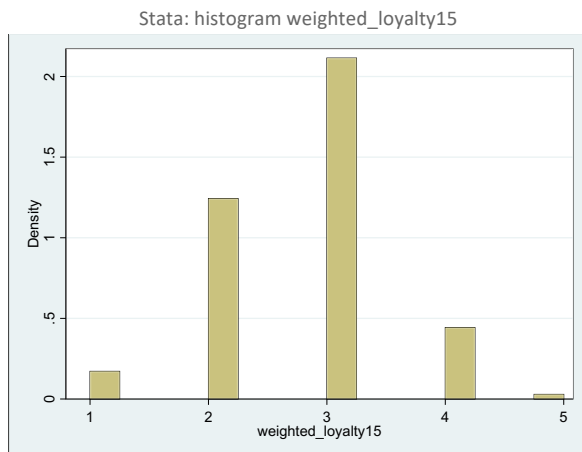

Agents 280 · Income: not used · $\beta_1 = 0$ · σ : none (turned off in the app)

Match

Research Specification – Loyalty – options ranking

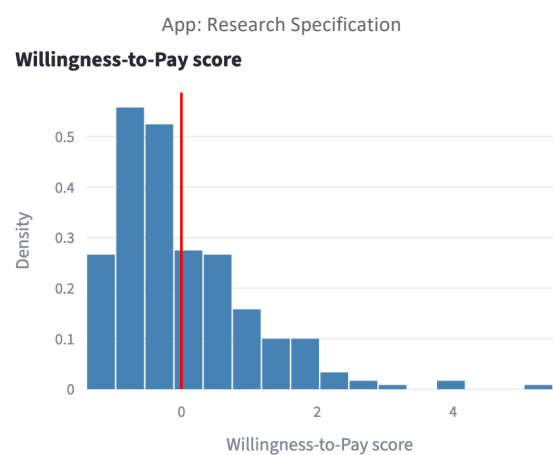

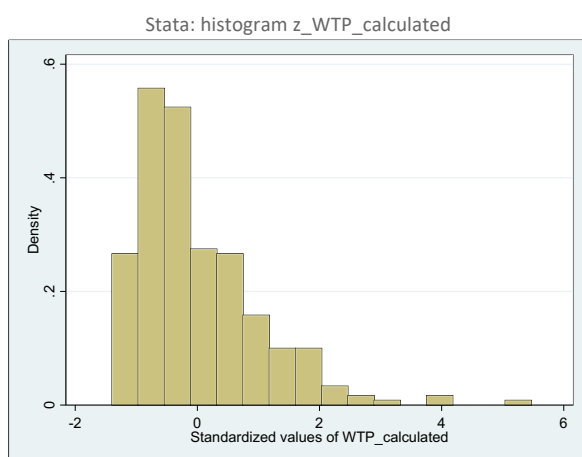

Agents 280 · Income: not used · $\beta_1 = 0$ · σ : none (turned off in the app)

Match (4.3 / 31.1 / 52.9 / 11.1 / 0.7 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Specification – Willingness-to-Pay – score (continuous income)

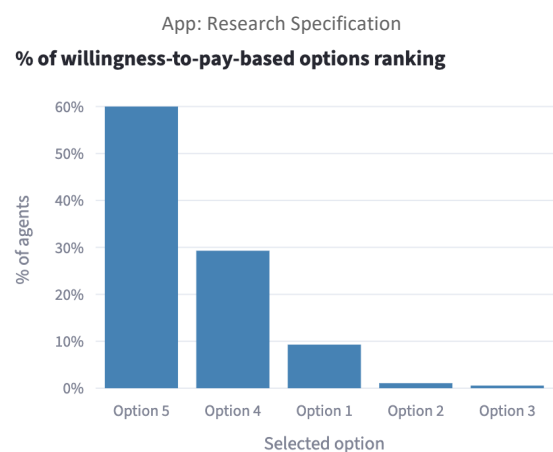

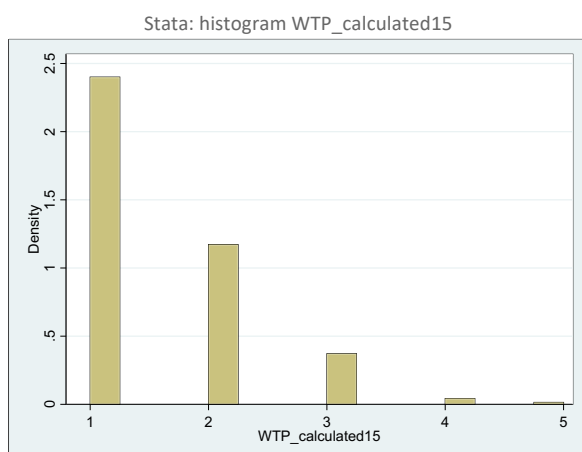

Agents 280 · Income: Continuous only · $\beta_2 = 0$ · σ : none (turned off in the app)

Match

Research Specification – Willingness-to-Pay – options ranking (continuous income)

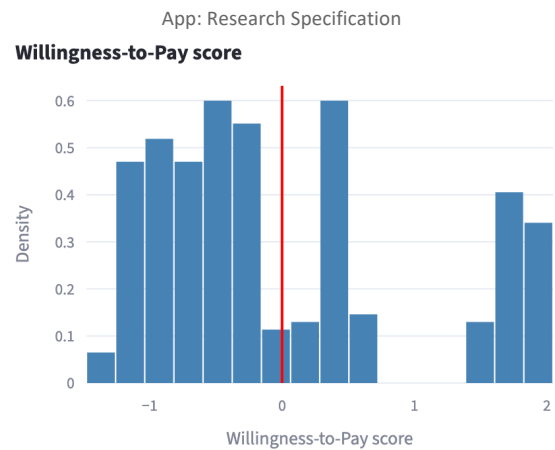

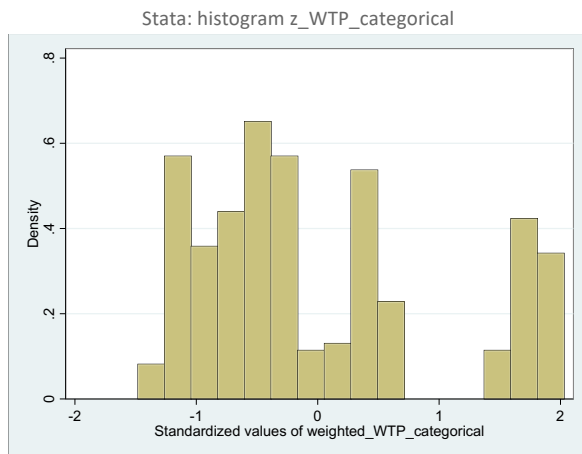

Agents 280 · Income: Continuous only · $\beta_2 = 0$ · σ : none (turned off in the app)

Match (60.0 / 29.3 / 9.3 / 1.1 / 0.4 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Specification – Willingness-to-Pay – score (categorical income)

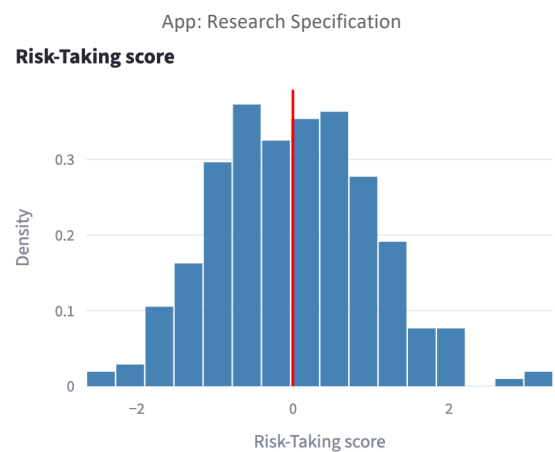

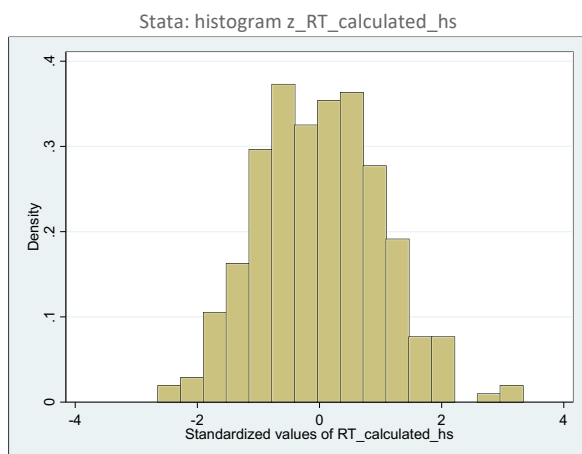

Agents 280 · Income: Categorical only · $\beta_2 = 0$ · σ : none (turned off in the app)

Does not match. In the Stata file, the lowest allowance level (57 participants) used the raw Agreeableness score instead of the standardised one; the other levels and the document use the standardised one, as the app does. Re-running Stata with that fix should make the graphs match.

Research Specification – Risk-Taking – score (continuous income)

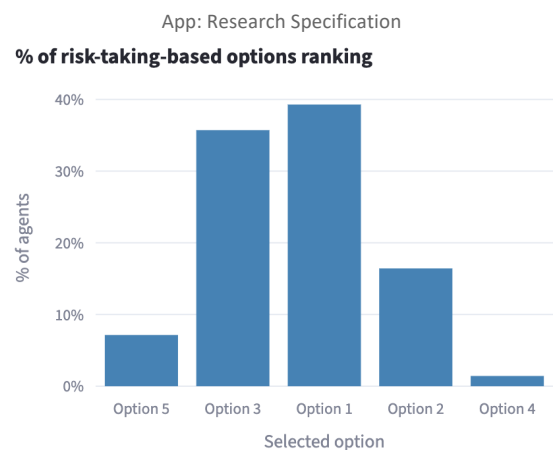

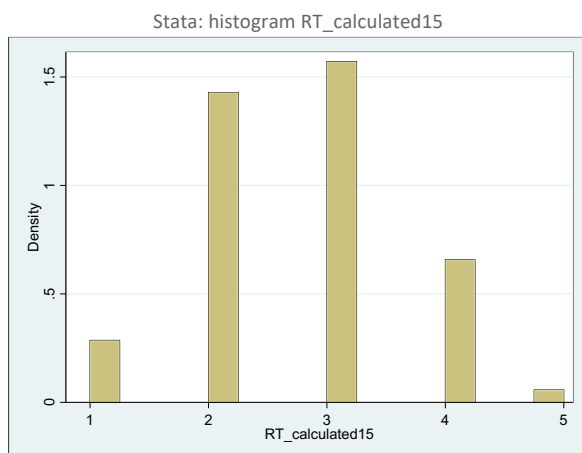

Agents 280 · Income: Continuous only · $\beta_3 = 0$ · σ : none (turned off in the app)

Match

Research Specification – Risk-Taking – options ranking (continuous income)

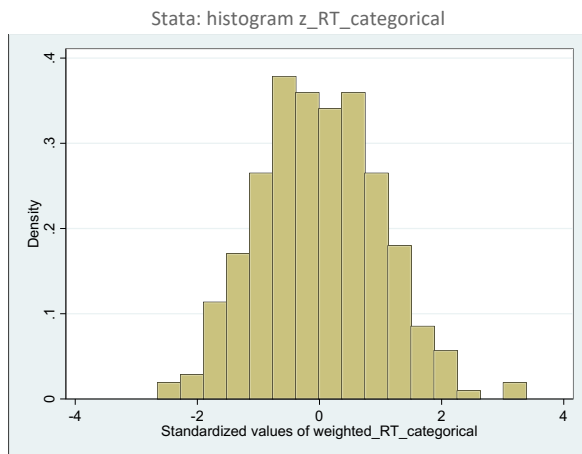

Agents 280 · Income: Continuous only · $\beta_3 = 0$ · σ : none (turned off in the app)

Match (7.1 / 35.7 / 39.3 / 16.4 / 1.4 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.

Research Specification – Risk-Taking – score (categorical income)

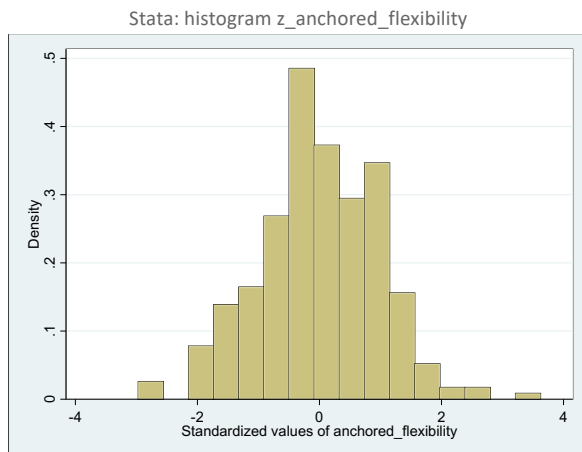

Agents 280 · Income: Categorical only · $\beta_3 = 0$ · σ : none (turned off in the app)

Match

Research Specification – Flexibility – score

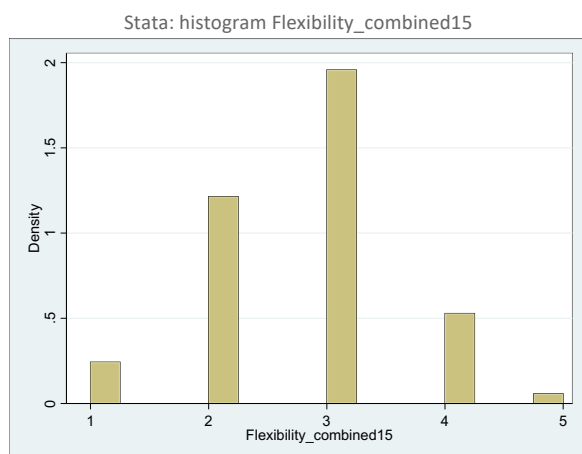

Agents 280 · Income: not used · $\beta_4 = 0$ · σ : none (turned off in the app)

Match

Research Specification – Flexibility – options ranking

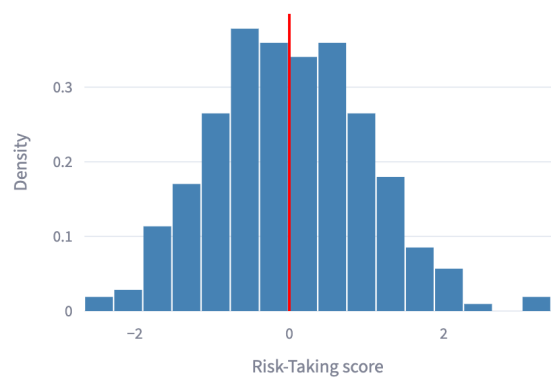

Agents 280 · Income: not used · $\beta_4 = 0$ · σ : none (turned off in the app)

Match (6.1 / 30.4 / 48.9 / 13.2 / 1.4 % of agents). Stata's y-axis is density, the app's is % of agents, and Stata numbers the bars 1–5 where the app names them by option, but the shape is the same.
